

Figure 2 — Activation adds NO joint-gain beyond flat aggregation

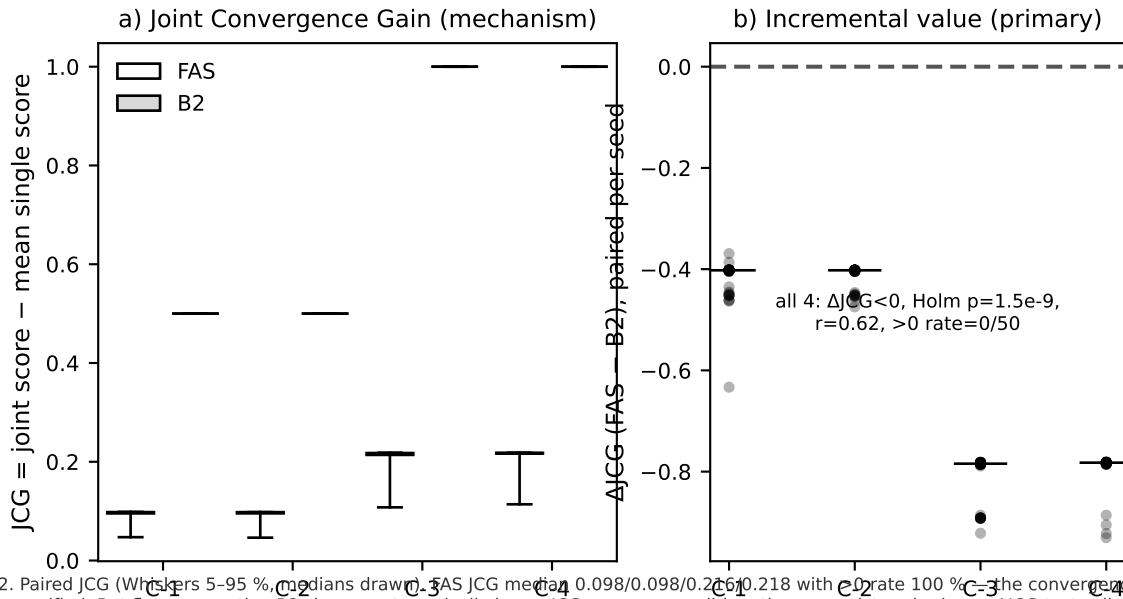

Figure 2. Paired JCG (Whiskers 5-95 %, medians drawn). FAS JCG median 0.098/0.098/0.261/0.218 with α rate 100 % = the convergence mechanism runs as specified. But flat aggregation B2 shows systematically larger JCG on every condition: the pre-registered primary ΔJCG tests all rejected in the reversed direction (Holm-adjusted $p = 1.5e-9$, $r = 0.62$; $\Delta JCG > 0$ rate 0/50).
