

Figure 3 — Noise robustness: no differential

Figure 3. Noise grid 0.090 % at the 3-input, 14 interference profile: both mechanisms sit at the chance level over the entire range (slopes ≈ 0). Diamonds/squares: the 5-input confirmatory points at noise 50 % / 75 % where both reach median MRR = 1.0 — noise tolerance is governed by input support, identically for both mechanisms. Robustness is not a differential property.
