

Figure 8 — Representative activation landscapes

a) shared hub combination (S16):
O3 must win

b) joint convergence:
single vs joint seeding (C-3)

Figure 8. (a) S16 combination task, seed 0, recomputed with the Campaign generator (same code, deterministic per seed). Under joint seeding the shared hub doubles its feed, giving O3 the top activation (FAS ranks O3 first in 30/30 seeds), while B2's path-product sum ranks O3 third in 30/30 (O1=0.64 before O3=0.50; the single pre-registered topology where dynamics beat flat aggregation). (b) C-3 seed 0: any single input gives the joint candidate negligible activation; joint seeding lifts it above the local 0.8-weight competitors — the convergence that we measure.
