

Figure 9 — Evidence hierarchy

Behavioral: persistent memory value under asymmetry
A10 beacon — fas_full 20/20 vs direct 0/20 (vs flat, ns)

Mechanism: multi-input convergence exists
JCG experiments — >0 rate .970 (here 1.000 / 4 conditions)

Topology steers propagation
A9 relation-direction — p .33→.65, p =.002, r =.886

Incremental value over flat retrieval — THIS experiment
 Δ JCG < 0 on all 4 confirmatory conditions (Holm p =1.5e-9, r =0.62);
MRR parity; single differential = §16 shared-hub combo (30/30)

Layers: behavior above, mechanism below;
incremental-value claim NOT supported at scale

Figure 9. Structured evidence map. A10: behavioral value of persistent memory. JCG experiments: the convergence mechanism runs. A9: topology sensitivity. This experiment: separates the layers — the incremental-value claim over flat aggregation fails on the pre-registered battery, with one counterfactual exception (§16 O3).
